Activity 2

Due:28th September 2026,23:59

Activity 2 Enhance Your First Website

What you will build

A small personal website about yourself as a student. A visitor should be able to find your introduction, hobbies, learning plan, photo gallery, short self-introduction video, audio clip and contact form. The form is a browser demonstration only;

Part A Prepare your project

1. Create a separate project folder named myweb. Copy the index.html file you made in Activity 1 into myweb, then save another copy there as activity1_backup.html before editing. Open the myweb folder in VS Code.
2. Inside myweb, create exactly these three subfolders: images, css and videos. Save your stylesheet as css/styles.css, at least three photos in images, and your short video and audio files in videos. Use simple filenames such as images/photo1.jpg, videos/intro.mp4 and videos/voice.mp3. The videos folder holds both types of media so no fourth subfolder is needed. Use only photos and recordings you made or are allowed to share.
3. Confirm myweb/index.html still has <!DOCTYPE html>, lang="en", a meaningful <title> and the viewport meta tag. Link the stylesheet from the <head> using the relative path below.

```
<link rel="stylesheet" href="css/styles.css">
```

Part B Improve the HTML content and structure

1. Replace the one long body with <header>, <nav>, <main> and <footer>. Inside <main>, create meaningful <section> elements for About Me, My Hobbies, My Learning Plan, My Photos, My Media and Contact. Use one <h1> for the page title and <h2> for section headings.
2. Keep the three hobby items from Activity 1 as a <ul>. Add an <ol> with at least three realistic steps you will take to improve your web skills. Write an About Me paragraph in your own words (at least 50 words).
3. In <nav>, add working links to at least four sections of this same page, including My Photos and My Media. Each link href must match the target section id, for example href="#hobbies" and id="hobbies". Add one useful external link related to learning web development, with descriptive link text.
4. In My Photos, show at least three different photos with <img> and relative paths such as images/photo1.jpg. Include a useful alt description for each photo. Give the gallery a heading and captions explaining what the photos show. Do not use images of other people without their permission; credit any photo you did not take yourself.

5. Add a small data table for your weekly web learning plan: a <caption>, a header row with <th>, and at least three data rows for Day, Topic, and Practice task. Use a table for this actual data, not to arrange the page.
6. In Contact, add a form containing a name field, an email field of type="email", a topic selection or text field, a message box, and a submit button. Connect every visible <label> to its control with for and id. Make name, email and message required. Leave submission local: action="#" is acceptable; explain that the form does not send data.

Part C Add your video and audio

1. Record a short video (about 30 to 60 seconds) introducing yourself. Say your name, your programme and one web skill you hope to learn. Save it in videos, for example videos/intro.mp4. In My Media, display it with <video controls> and a short description. Provide a written summary of what you say so the introduction remains accessible without sound.
2. Record a short audio clip (about 15 to 30 seconds) describing one of your hobbies or your reason for studying web technologies. Save it in videos, for example videos/voice.mp3, and display it with <audio controls>. Add one or two sentences beneath it describing the recording.
3. Use relative file paths for both media files. Keep recordings short enough for the project ZIP to be practical to upload. Test the players in the browser; controls must let a visitor start and pause each recording.

Part D Style the page with CSS

1. Use css/styles.css as the main place for styling. Choose a coherent color palette with enough contrast, a readable font-family, appropriate font sizes, and a comfortable line height. Style the title and section headings so the page looks polished rather than using default browser styling.
2. Style the header, navigation, main sections, photo gallery, media players, table and form. Show the box model deliberately with padding, margin and a visible border on at least one section. Use a class selector for repeated sections and an id selector for one unique section; include at least one element selector.
3. Make links and the submit button attractive and clearly identifiable, including a visible hover or focus state. Give images and videos max-width: 100% and height: auto so they fit the screen. Arrange the photos neatly using CSS and check the page at a narrow browser width without horizontal scrolling.

A small example to get started

Adapt these fragments to your own content. They are examples, not a complete website.

```
<nav><a href="#hobbies">My hobbies</a></nav>
<section id="hobbies" class="content-section">
  <h2>My hobbies</h2>
  <ul><li>Reading</li><li>Football</li><li>Coding</li></ul>
</section>
.content-section { padding: 1rem; margin: 1rem 0; border: 1px solid #456; }
#hobbies { background-color: #f1f6fa; }
img { max-width: 100%; height: auto; }
```

Part E Test and submit

1. Save the files, then open myweb/index.html with Live Server. Click every navigation link and the external link. Check all three photos, the video, audio, table and form. Play both recordings to confirm the sound and picture work. Test that the browser blocks an empty required field and an invalid email.

2. Resize the browser to a phone-like width. Check that text stays readable, photos and video scale, controls remain usable, and there is no sideways page scrolling. Ask a classmate to locate your photo gallery and play your introductions without guidance.

Submission

Upload your code on github and share your repository link on the google form which will be shared.
